For Loop Based Programming

Program

Logic

Syntax

Problems Set 1

1. WAP to print all even numbers from 1 to n using for loop, when n will be given by the user.

*Explanation: If n is 10 then the result will be the even numbers which lie between 1 and 10 i.e., **2,4,6,8,10***

2. WAP to print all odd numbers from a to b using for loop, when a and b will be given by the user.

*Explanation: If a is 3 and b is 10 then the result will be the odd numbers which lie between 3 and 10 i.e., **3,5,7,9***

3. WAP to input a number & print its well formatted table.

Explanation: If the number is 5 then the result will be the well formatted table of 5 i.e.,

$5 \times 1 = 5$

$5 \times 2 = 10$

.....

$5 \times 10 = 50$

Solution of Problem Set 1

1. WAP to print all even numbers from 1 to n

```
import java.util.*;
class even_numbers{
    public static void main(String Args[]) {
        int i,n;
        Scanner sc= new Scanner(System.in);
        System.out.println("Enter a number");
        n= sc.nextInt();
        for(i=1; i<=n; i++) {
            if(i%2==0)
                System.out.println(i);
        }
    }
}
```

2. WAP to print all odd numbers from a to b

```
import java.util.*;
class odd_numbers{
    public static void main(String Args[]) {
        int i,a,b;
        Scanner sc= new Scanner(System.in);
        System.out.println("Enter lower limit and upper limit");
        a= sc.nextInt();
        b= sc.nextInt();
        for(i=a; i<=b; i++)
        {
            if(i%2!=0)
                System.out.println(i);
        }
    }
}
```

Solution of Problem Set 1

3. WAP to input a number & print its well formatted table.

```
import java.util.*;
class table
{
    public static void main(String Args[])
    {
        int i,n;
        Scanner sc= new Scanner(System.in);
        System.out.println("Enter a number of which table has to printed");
        n= sc.nextInt();
        for(i=1;i<=10;i++)
        {
            System.out.println(n+" * "+i+" = "+(i*n));
        }
    }
}
```

Problems Set 2

1. WAP to print the sum of first n natural numbers.

Explanation: If n is 10 then the result will be the sum of natural numbers from 1 to 10 i.e.,
 $1+2+3+4+5+6+7+8+9+10 = 55$

2. WAP to input a number n & print its factorial.

Explanation: If n is 5 then the factorial of 5 is the product of the natural numbers from 1 to 5 i.e., **$1*2*3*4*5 = 120$**

3. WAP to input a number n & print all its factors.

Explanation: If the number is 10 then the result will be its list of factors(which are divisible by that number) i.e., **1, 2, 5, 10**

4. WAP to input a number & print its odd factors.

Explanation: If the number is 10 then the result will be its list of odd factors(which are divisible by that number and are odd) i.e., **1, 5**

Solution of Problem Set 2

1. WAP to print the sum of first n natural numbers.

```
import java.util.*;
class sum
{
    public static void main(String Args[])
    {
        int i,n,s=0;
        Scanner sc= new Scanner(System.in);
        System.out.println("Enter a number");
        n= sc.nextInt();
        for(i=1;i<=n;i++)
        {
            s=s+i;
        }
        System.out.println("Sum is:"+ s);
    }
}
```

2. WAP to input a number n & print its factorial.

```
import java.util.*;
class factorial
{
    public static void main(String Args[])
    {
        int i,n,f=1;
        Scanner sc= new Scanner(System.in);
        System.out.println("Enter a number");
        n= sc.nextInt();
        for(i=1;i<=n;i++)
        {
            f=f*i;
        }
        System.out.println("Factorial is:"+ f);
    }
}
```

Solution of Problem Set 2

3. WAP to input a number n & print all its factors.

```
import java.util.*;
class factors
{
    public static void main(String Args[])
    {
        int n,i;
        Scanner sc= new Scanner(System.in);
        System.out.println("Enter a number");
        n= sc.nextInt();
        for(i=1;i<=n;i++)
        {
            if(n%i==0)
            {
                System.out.print(i+" ");
            }
        }
    }
}
```

4. WAP to input a number & print its odd factors.

```
import java. util. *;

class odd_factors
{
    public static void main(String Args[])
    {
        int i,n,flag=0;
        Scanner sc = new Scanner(System.in);
        System.out.println("Enter a number");
        n=sc.nextInt();
        for(i=1;i<=n;i++)
        {
            if(n%i==0 && i%2!=0)
            {
                System.out.println(i+" ");
            }
        }
    }
}
```
