Parameters in JAVA

What are Parameters?

- Information can be passed to methods as parameter. Parameters act as variables inside the method.
- Parameters are specified after the method name, inside the parentheses. You can add as many parameters as you want, just separate them with a comma.

or

- Parameters are the values that is passed to the function from outside.
- Example:- `public static void myMethod(int a, int b)`

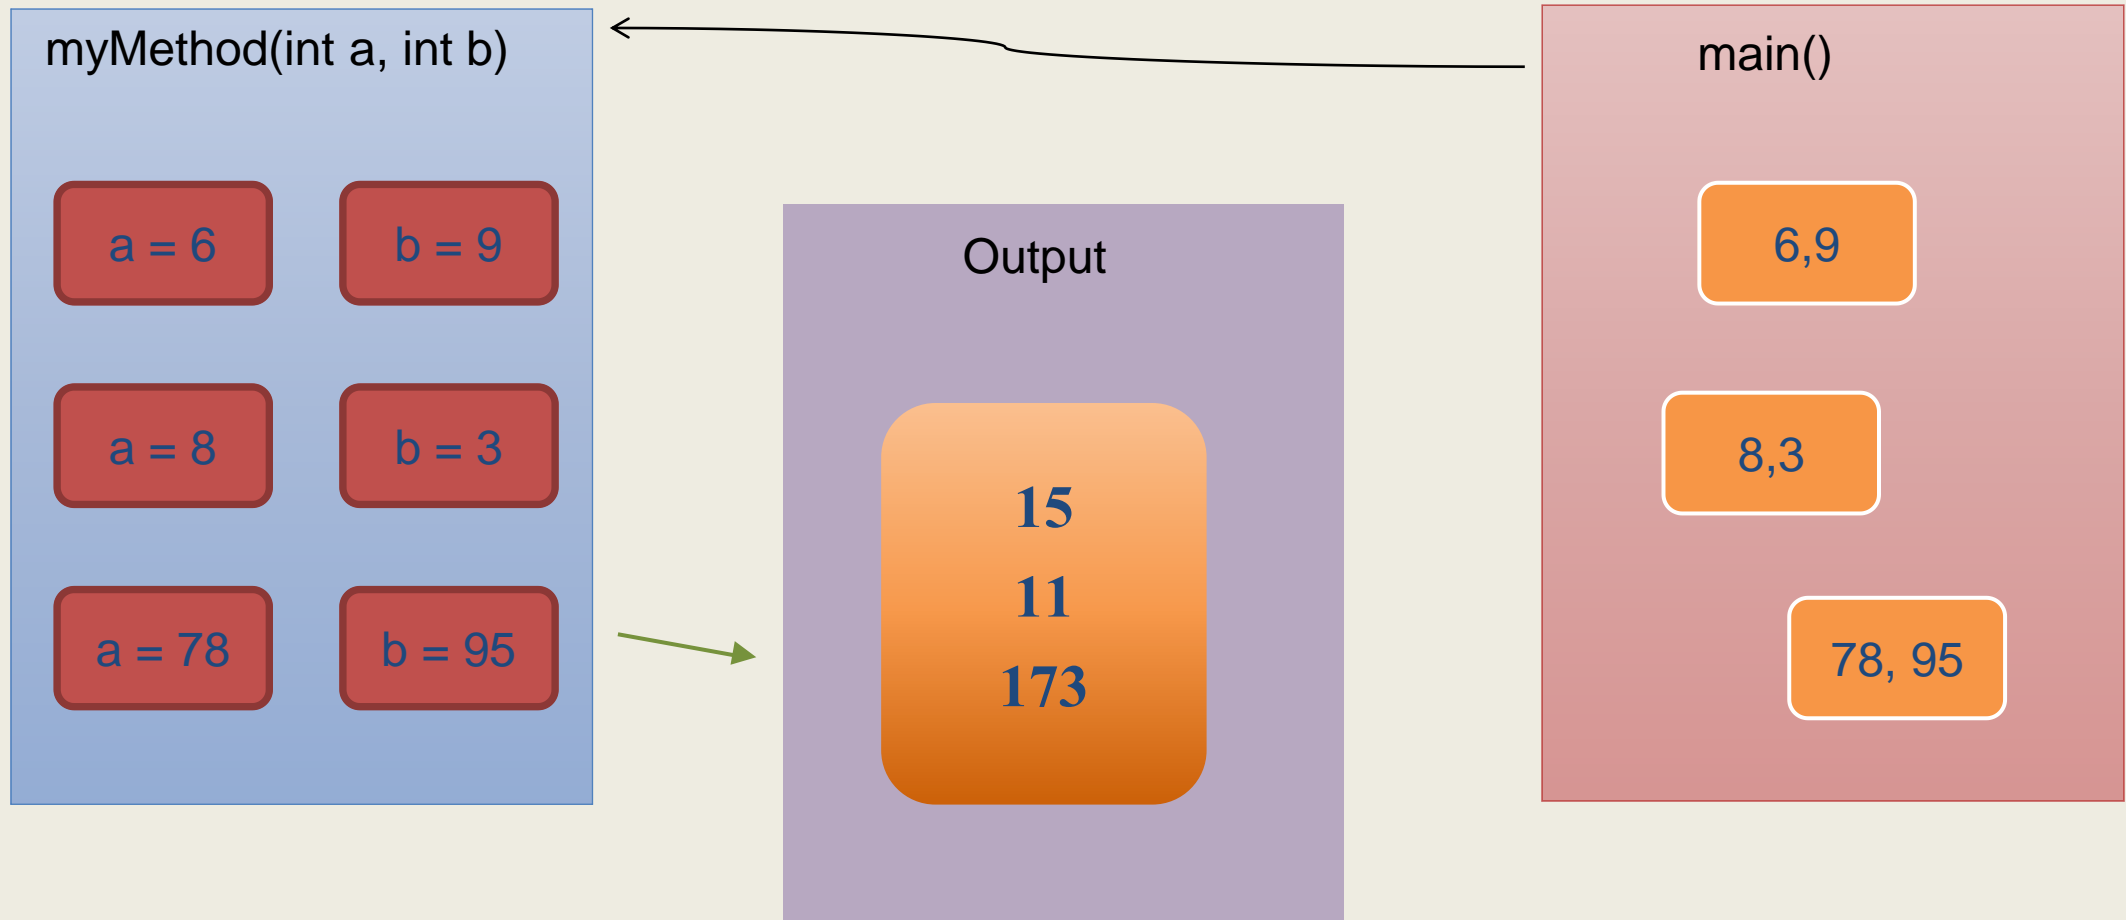

Example Passing a Parameter To A Function

- The following example has a method that takes two parameters **a** and **b** as integers. When the method is called, we pass two numbers which is used inside the method to print their sum:

```
public class Main {  
    static void myMethod(int a, int b) {  
        System.out.println(a+b);  
    }  
    public static void main(String[] args) {  
        Main.myMethod(6,9);  
        Main.myMethod(8,3);  
        Main.myMethod(78,95);  
    }  
}
```

Graphical Representation

Values gets transferred from main() to myMethod()

Types Of Parameters In Java

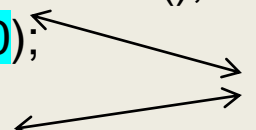

Actual Parameters

- The parameters which appears in function calling statement are called actual parameters.

- Example:-

```
public static void main(String Args[])
{
    Test ob= new Test();
    ✓ ob.large(5,10);
    ✓ Int x=5,y=10;
      ob.large(x,y);
}
```

Actual parameters

Formal Parameters

- The parameters which appears in function definition/prototype are called formal parameters.

- Example:-

```
class test{
    void large(int a, int b)
    {
        // Body of the function
    }
```

Formal parameters
