

Object Oriented
Programming

VS

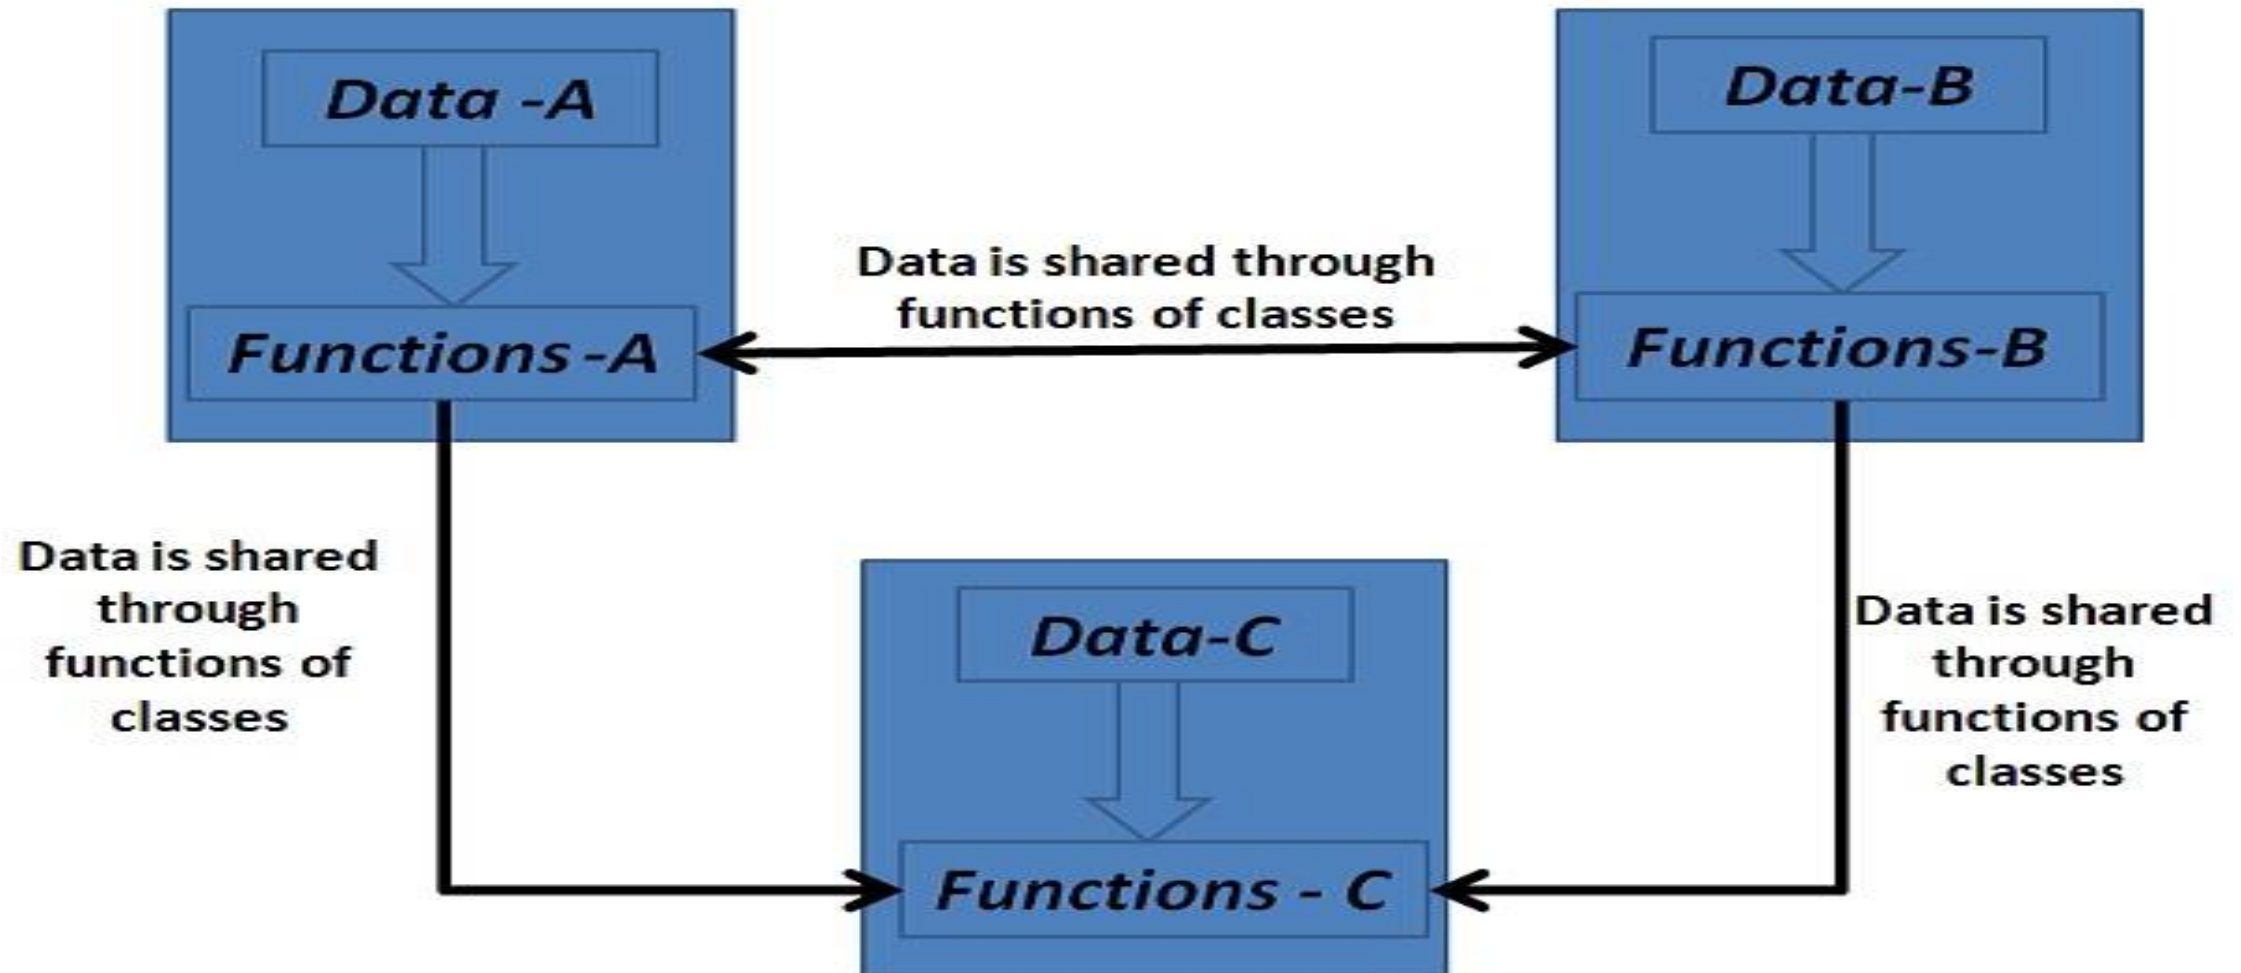

Procedural Oriented
Programming

Structure Of Procedural Oriented Programming

Data Flow In Object Oriented Programming

OOP's Vs POP

Object Oriented Programming

- In OOP, program is divided into parts called **objects**.
- OOPs provide Data Hiding so provides **more security**.
- OOP's main focus is on **data security** as only the objects of a class are allowed to access the attributes or function of a class.
- It follows **bottom-up** approach.
- Examples of OOP are: C++, JAVA, VB.NET, C#.NET

Procedural Oriented Programming

- In POP, program is divided into small parts called **functions**.
- POP does not have any proper way for hiding data so it is **less secure**.
- The main focus of POP is on “**how to get the task done**” it follows the flow chart to get the task done
- It follows **top-down** approach.
- Examples of POP are: C, VB, FORTRAN, Pascal.

OOPS (Object-Oriented Programming System)

Happy Learning!!
