Module 5: Previous Year Board Questions

Program

Logic

Syntax

Programs [2017 & 2016]

1. Write a program to accept a number and check and display whether it is a **Spy number** or not.
(A number is spy if the sum of its digits equals the product of its digits).

Example : Consider a number 1124

Sum of digits: $1+1+2+4=8$ and

*Product of digits: $1*1*2*4=8$.*

Sum = Product

Hence 1124 is a spy number.

2. Write a program to accept a number and check and display whether it is a Niven number or not. (Niven number is that number which is divisible by its sum of digits).

Example: Consider the number 126

Sum of its digits is $1 + 2 + 6 = 9$ and 126 is divisible by 9.

Solution of Spy number

```
1. import java.util.Scanner;
class spy {
    public static void main(String Args[]){
        int num, product=1, sum=0, lastdigit;
        Scanner sc = new Scanner(System.in);
        System.out.print("Enter the number to check: " );
        num=sc.nextInt();
        while(num>0) {
            lastdigit=num%10;
            sum=sum+lastdigit;           //adds last digit to the variable sum
            product=product*lastdigit;
            num=num/10; //removes the last digit from the given number
        }
        if(sum==product) //compares the sum and product
            System.out.println("The given number is a spy number."); //prints if the above condition returns true
        else
            System.out.println("The given number is not a spy number."); //prints if the above condition returns false
    }
}
```

Solution of Niven number

```
2. import java.util.Scanner;
class niven{
    public static void main(String Args[]){
        int num, sum=0, lastdigit;
        Scanner sc = new Scanner(System.in);
        System.out.print("Enter the number to check: " );
        num=sc.nextInt();
        int t = num;
        while(num>0) {
            lastdigit=num%10;
            sum=sum+lastdigit; //adds last digit to the variable sum
            num=num/10; //removes the last digit from the given number
        }
        if(t % sum ==0)
            System.out.println("The given number is a niven number."); //prints if the above condition returns true
        else
            System.out.println("The given number is not a niven number."); //prints if the above condition returns false
    }
}
```

Programs [18,06,07]

- Write a program to input a number and check and print whether it is a **Pronic** number or not. (**Pronic** number is the number which is the product of two consecutive integers)

Examples:

$$12 = 3 \times 4$$

$$20 = 4 \times 5$$

$$42 = 6 \times 7$$

- Write a program to accept a number and check whether the number is Armstrong or not. A number is said to be Armstrong, if the sum of the cubes of its digits is equal to the original number.

Example: Input: 153

Output: Armstrong Number($1^3 + 5^3 + 3^3 = 153$) - Already learned in lectures

- Write a program to calculate and print the sum of odd numbers and the sum of even numbers for the first n natural numbers. The integer n is to be entered by the user. - Already done

Solution of Pronic Number

```
import java.util.*;
class pronic {
    public static void main(String args[]){
        Scanner sc = new Scanner(System.in);
        System.out.print("Input a number : ");
        int num = sc.nextInt();
        int ans = 0;
        for(int i=0; i<num; i++) {
            if(i*(i+1) == num) {
                ans = 1;
                break;
            }
        }
        if(ans == 1)
            System.out.println("Pronic Number.");
        else
            System.out.println("Not a Pronic Number.");
    }
}
```

Programs [08,15]

- Write a program to calculate and print the sum of each of the following series:
 - a.) $\text{Sum (S)} = 2 - 4 + 6 - 8 + \dots - 20$
 - b.) $\text{Sum (S)} = \underline{x} + \underline{x} + \underline{x} + \underline{x} + \dots \underline{x}$
 $\qquad\qquad\qquad 2 \quad 5 \quad 8 \quad 11 \quad 20$
- A special two-digit number is such that when the sum of its digits is added to the product of its digits, the result is equal to the original two-digit number
Example : Consider the number 59.
Sum of digits = $5 + 9 = 14$
*Product of its digits = $5 * 9 = 45$*
Sum of sum of digits and product of digits = $14 + 45 = 59$

Write a program to accept a two-digit number. Add the sum of its digit to the product of its digits. If the value is equal to the number input, output the message "Special 2-digit number" otherwise, out put the message "Not a special 2-digit number".

Solution of Series Program

```
import java.util.*;
class series {
    public static void main(String args[]){
        Scanner sc = new Scanner(System.in);
        System.out.print("Input a number : ");
        int x = sc.nextInt();
        int i,sum1=0, sign=1,sum2=0;
        for(i=1; i<=10; i++){
            sum1= sum1+(i*2);
            sign=sign*-1;
        }
        for(i=1;i<=7;i++){
            sum2= sum2+x/(3*i-1);
        }
        System.out.println("The sum of first series is"+sum1);
        System.out.println("The sum of second series is"+sum2);
    }
}
```

Solution of Special number

```
import java.util.*;
class special {
    public static void main(String Args[]){
        int num, product=1, sum=0, lastdigit;
        Scanner sc = new Scanner(System.in);
        System.out.print("Enter the number to check: " );
        num=sc.nextInt();
        int t= num;
        while(num>0) {
            lastdigit=num%10;
            sum=sum+lastdigit; //adds last digit to the variable sum
            product=product*lastdigit;
            num=num/10; //removes the last digit from the given number
        }
        if(sum+product ==t) //compares the sum + product with number
            System.out.println("The given number is a special number."); //prints if the above condition returns true
        else
            System.out.println("The given number is not a special number."); //prints if the above condition returns false
    } }
```

Program [2013]

- The International Standard Book Number (ISBN) is a unique numeric book identifier which is printed on every book. The ISBN is based upon a 10-digit code. The ISBN is legal if:

$1 * \text{digit}_1 + 2 * \text{digit}_2 + 3 * \text{digit}_3 + 4 * \text{digit}_4 + 5 * \text{digit}_5 + 6 * \text{digit}_6 + 7 * \text{digit}_7 + 8 * \text{digit}_8 + 9 * \text{digit}_9 + 10 * \text{digit}_{10}$ is divisible by 11.

Example : For an ISBN 1401601499

Sum = $1 * 1 + 2 * 4 + 3 * 0 + 4 * 1 + 5 * 6 + 6 * 0 + 7 * 1 + 8 * 4 + 9 * 9 + 10 * 9 = 253$ which is divisible by 11.

Write a program to:

- Input the ISBN code as a 10-digit integer.
- If the ISBN is not a 10-digit integer, output the message, “Illegal ISBN” and terminate the program
- If the number is 10-digit, extract the digits of the number and compute the sum as explained above.
 - If the sum is divisible by 11, output the message, “Legal ISBN”. If the sum is not divisible by 11, output the message, “Illegal ISBN”.

Solution of ISBN Program

```
import java.util.*;
class isbn{
    public static void main(String Args[]){
        int isbn, sum=0, lastdigit,c=0;
        Scanner sc = new Scanner(System.in);
        System.out.print("Enter the ISBN to check: " );
        isbn=sc.nextInt();
        int t = isbn;
        while(isbn>0) {
            c++;
            isbn=isbn/10;
        }
        if(c==10){
            int a= 10;
            while(t>0){
                lastdigit = t%10;
                sum = sum+(lastdigit*a);
                t=t/10;
                a--;
            }
        }
        System.out.println(sum);
        if(sum%11==0)
            System.out.println("Legal ISBN");
        else
            System.out.println("Illegal ISBN");
    }
}
```

Program [2010, 11]

- WAP to print first n terms of Fibonacci series. The integer n is to be entered by the user.
 - The Fibonacci numbers are the numbers in the following integer sequence.
0, 1, 1, 2, 3, 5, 8, 13, 21, 34, 55, 89, 144,
 - The Fibonacci series is a series where the next term is the sum of the previous two terms. The first two terms of the Fibonacci sequence are 0 followed by 1.
 - Enter the number of elements n : 10*
 - Output: 0 1 1 2 3 5 8 13 21 34*
- WAP to input a number and check whether it is Automorphic or not. –
[Already Covered]

Solution of Fibonacci Series

```
import java.util.*;
class fibonacci {
    public static void main(String Args[])
    {
        int a,b,c,i,n;
        Scanner sc = new Scanner(System.in);
        System.out.print("Enter the value of n");
        n=sc.nextInt();
        a=0;
        b=1;
        c=a+b;
        System.out.print(a);
        System.out.print(" "+b);
        System.out.print(" "+c);
```

```
        for(i=1;i<=n-3;i++)
        {
            a=b;
            b=c;
            c=a+b;
            System.out.print(" "+c);
        }
    }
}
```
